**Now we will take  
a closer look at  
"region".**

### Geography

Five Themes to Help Understand the World and its People

## Focus on "Region"

❖ **A region is a part of the earth exhibiting similar traits or characteristics.**

- ✓ A region can be **natural** or **cultural** or a unique **combination of both**.
- ✓ Helps us to bring order to a diverse planet by dividing the earth up into unique areas.
- ✓ Makes it easier to study and compare these areas by setting them apart from others.
- Regions with different characteristics can overlap.

## Region

**All regions have five characteristics:**

1. **Location:** we can find it on earth.
2. **Spatial Extent:** we can measure it.
3. **Boundaries:** we can set its limits based on selected/observed characteristics.  
*(However, most boundaries are "fuzzy" and blend into each other.)*

## Region

**All regions have 5 characteristics:**

**4. Categorization:**  
The three categories are:

- a) **formal** (exhibit a uniform appearance)
- b) **functional** (created by interaction or connections)
- c) **vernacular** (mental or perceptual)

### 4a: Formal Region

An area that exhibits a uniform appearance or characteristic.

**Political regions (counties) of NYS**

**ALSO, there are:**  
Economic regions  
Landform regions  
Ecoregions  
Agricultural regions  
Cultural regions  
Language regions  
Urbanized regions

## Geographic Methodologies

<p><b>Geography of the Present</b></p> <p>We study <b>current</b> conditions, interrelationships and happenings.</p> <p>It focuses on today.</p> <p>It goes back in time to set the scene.</p> <p>It evaluates the present for future interactions.</p>	<p><b>Geography of the Past</b></p> <p><b>Historical geography</b> looks at and analyzes the conditions that have led to or influenced the <b>actions of people over time</b>.</p> <p>The emphasis is on <b>developmental processes</b>. It studies <b>change</b>.</p>
<p><b>Geography of the Future</b></p> <p>Uses the knowledge gained from the past and present to <b>make assumptions</b> about the future. Regional and urban planning are examples of this.</p>	

13

## GEOGRAPHIC RESEARCH

1. Assess the need.
2. Collect information.
3. Process the data.
4. Analyze/interpret the data.
5. Create an output.
6. Apply to a real world situation.
7. **Back to 1:** Re-assess the need (for as many times as needed)

This diagram is in the Handout Section of the course homepage.

14

## Geographic Methodologies

**All three methodologies** (past, present and future)

- ✓ Are studied from **geographic dualisms point of view**.
- ✓ Use **geographic research methods to gather and analyze data**.
- ✓ Look for and analyze **patterns of spatial distribution, always asking the question, WHY?**
- ✓ Use **cartographic methods** (mapping) and **geographic information software and technology** (gathering/analysis/mapping) to **portray information spatially**.

15

## SPATIAL DISTRIBUTION

**Spatial distribution is the essence of geography.**

We need to distinguish between the following:

- ❖ DENSITY
- ❖ CONCENTRATION
- ❖ PATTERN
- ❖ SPATIAL INTERACTION (issues of distance)
- ❖ DIFFUSION (issues of spread)

16

## Spatial Distribution Definitions

1. **DENSITY:** the number of times something exists within a given unit (space)  
*(as people per sq. mi. or seats per 400 sq. ft. classroom)*
2. **CONCENTRATION:** grouping of density  
*(clustered or dispersed; proximity to each other)*
3. **PATTERN:** the arrangement of density  
*(as linear, rectangular, circular, centralized, random)*

17

## 1. Density: the number of times something exists within a unit

9 Dots

Box 1

12 Dots

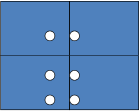

Box 2

20 Dots

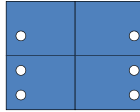

Box 3

**Which box has the greatest density?**

## 2. Concentration: the grouping

Clustering

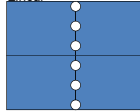

Dispersion

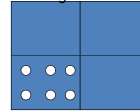

Grouping refers to the proximity to each other.

**Each grid has the same density but in different concentrations.**

## 3. Pattern: the arrangement

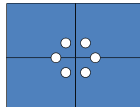

Linear

Rectangular

Each grid has the same density.

However, they have different arrangements (patterns) and different concentrations (groupings).

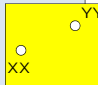

Circular

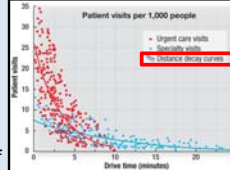

Random

## 4. Spatial Interaction: Definitions

- ❖ **Spatial interaction** is the movement and contact between points.
  - a) **Distance:** How far?
    - ✓ Linear distance
    - ✓ Time distance
    - ✓ Psychological distance
  - b) **Connectivity:** linkage; connection of points
  - c) **Accessibility:** ease of movement along links
  - d) **Distance Decay:** frequency of contact decreases with distance

How far is "XX" from "YY"?  
How do we determine it?

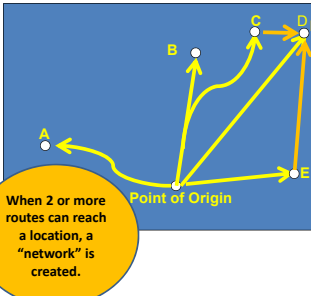

Patient visits per 1,000 people

Greatest ← Interaction → Least

## 5. Diffusion: Spread from point of origin

When 2 or more routes can reach a location, a "network" is created.

**We ask:**

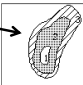

- Why was there movement away from point of origin?
- What route was taken? **and**
- How did that route facilitate movement?
- Are there alternate routes to get to the same location?

**4 TYPES of DIFFUSION**

- Expansion diffusion
- Relocation diffusion
- Contagious diffusion
- Hierarchical diffusion

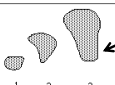

## Types of Diffusion

**a) EXPANSION**  
Movement away from point of highest concentration; there's an increase in both area and numbers.

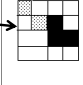

(a) Expansion diffusion

**c) RELOCATION**  
Migration; actual movement away to another location.

(b) Relocation diffusion

**b) CONTAGIOUS**  
Contact and exchange between adjoining areas; person-to-person contact, blending.

(c) Contagious diffusion

**d) HIERARCHICAL**  
Movement between levels – "up the ladder"; skipping areas in between (as moving from the small town to big city without stopping at the smaller cities).

(d) Hierarchical diffusion

**COVID-19 has used all four means of diffusion to spread worldwide.**

## Diffusion: Spread of Cholera in the U.S. 1832 and 1849

Disease spreads from ports of entry along lines of transportation.

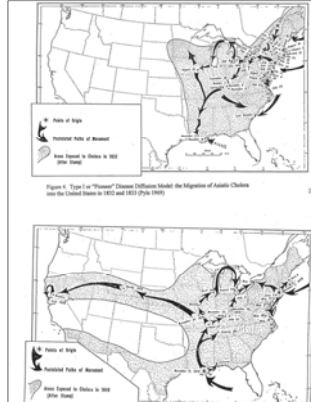

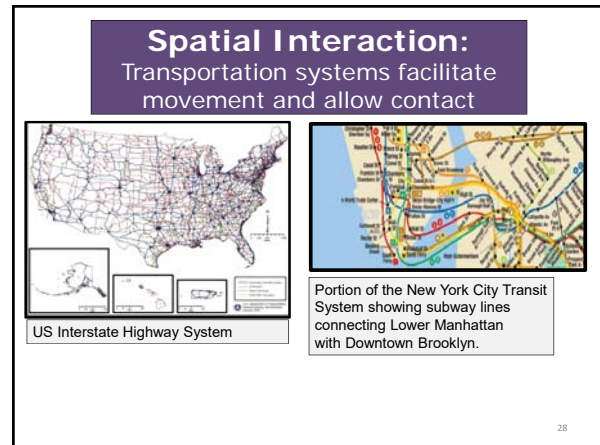

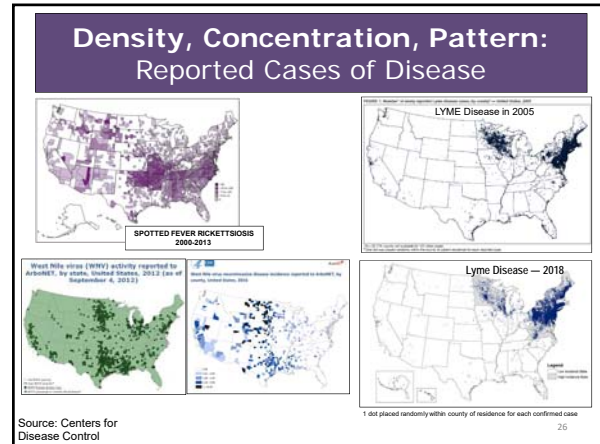

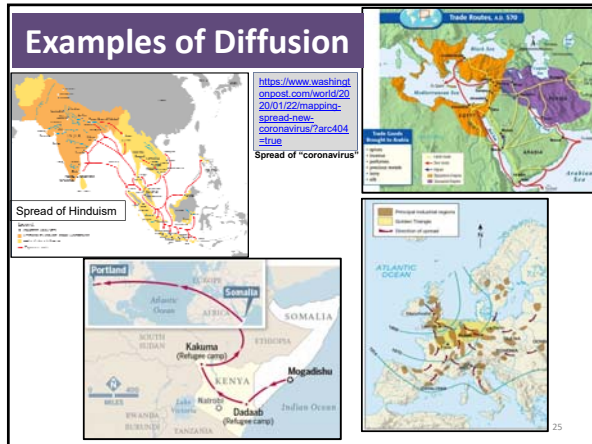

Figure 4. Types of "Point" Disease Diffusion Model: the Migration of Asiatic Cholera into the United States in 1832 and 1833 (1836-1849)
